Flood Relief Scheme

Newsletter No.5
November 2021

WHAT STAGE IS THE PROJECT AT?

The Burnfoot FRS Steering Group (comprising of the OPW, Donegal County Council and RPS) are continuing to ensure that ongoing hydrological and hydraulic analysis to support the development of a Flood Relief Scheme is based on the most accurate and up to date information. All project information remains available on the project website www.countydonegalfrs.ie/burnfoot including contact details for the team.

Surveys capturing the data needed to build an up to date computer model of the Burnfoot and Skeoge Rivers, tributaries, existing defences, culverts and floodplains in the area are complete.

Using this data we have built a computer model to represent the Skeoge River, and the Burnfoot River and its tributaries. We have added river flows, water levels and rainfall inputs to drive the model and replicate flood conditions, for past and future predicted (design) events. Our team has fine-tuned the model to check that it is as accurate as possible, particularly in relation to the August 2017 flood. This made use of the data (photographs and reports) of past flood events provided by local residents, business owners and stakeholders to ensure the closest representation of events which took place on the ground in Burnfoot.

We are now developing options and considering potential flood risk management measures which may be applicable at Burnfoot. The list will be inclusive of, but not limited to those outlined in North Western Flood Risk Management Plan (www.floodinfo.ie), with all measures being screened, identifying those that could be progressed for a more detailed assessment. A technical workshop to discuss the development of options was held in early November 2021 and was attended by the Burnfoot FRS Steering Group.

The RPS Environmental Team completed the Environmental Constraints Study report in late August, which considers the key environmental issues which may be impacted by, or impose constraints on, the flood scheme. The report considers Biodiversity, Flora and Fauna, Soils and Geology, Archaeology, Architectural and Cultural Heritage, Land Use and Material Assets, Landscape and Visual Impact, in addition to Population and Human Health. The report will be available on the project website soon.

Further detailed environmental surveys have taken place since August including the completion of ecological surveys that are seasonally constrained, e.g. aquatic ecology and fisheries surveys and the ongoing over-wintering bird surveys in Burnfoot. These specialist surveys build on the initial baseline surveys already undertaken in 2020 and to date in 2021.

Whooper swans feeding on Inch Levels at Burnfoot

IMPACT OF CORONAVIRUS (COVID-19)

The project team have worked hard to ensure that all activities on the project are in compliance with the public health guidance on Coronavirus whilst at the same time trying to reduce negative impacts on the project programme. The Burnfoot FRS Steering Group have continued to meet regularly using video conferencing. Progressing flood relief schemes has been deemed as an essential service by local authorities.

OUTLINE SCHEME PROGRAMME

	Activity	2020	2021	2022	2023	2024	2025
Stage 1	Data Collection and surveys	■					
	Hydrological Analysis	■		■			
	Hydraulic Analysis		■		■		
	Scheme analysis & development		■	■			
Stage 2	Planning			■			
Stage 3	Detailed design of Scheme				■		
Stage 4	Construction works					■	
Stage 5	Scheme Operational						■

Timelines provided as current best estimate, but are subject to revision.

NEXT STEPS

Data Collection: All outstanding data sets in relation to Stage I of the Project have been received.

Surveys: The detailed surveys have been completed. Final data has been provided to the Project Team for use in the hydraulic model. RPS are currently looking at whether further surveys are needed to inform the preliminary design of a scheme.

Hydrological Analysis: The design flows and water levels which are used within the models to simulate flooding have been finalised, and the Draft hydrology report is complete.

Hydraulic Analysis: The hydraulic model has been calibrated and validated using data from historical flood events to ensure that it provides an accurate representation of the flooding mechanisms. The model will now be used to assess and compare various engineered options which will reduce the flood risk in Burnfoot.

Scheme Analysis and Development: A list of all potential flood risk management measures which may be applicable at Burnfoot is currently being produced. These will be screened so that measures which could be technically and economically viable, and socially and environmentally acceptable are taken forward for detailed assessment.

Environmental Assessment: Further surveys are proposed in the coming months including protected species surveys, archaeological and architectural surveys.
